

HELP GUIDE

Features:

- HD & 4K video playback
- Simple USB thumb drive loading and playback of content
- Synchronized content across multiple displays
- Control from any MAC, Windows or Android Wi-Fi device
- Can add LED lighting and assign colors to each video
- No 24 hour power required
- No space taken up - "zero footprint"
- Add video switcher (8x8 ATEN seamless) to display up to 8 sources and control them from PPP
- Control directly from Windows PowerPoint via action command
- Remote VPN tech support (requires internet connection)
- Cellular routers available

What to ask clients - fact finding:

Answers to these questions will help arm your systems engineers and AV techs to spec the appropriate media control and display equipment for each project.

- What are you trying to accomplish as it pertains to media playback, single monitor, multiple monitors, monitor arrays?
- How much content will you be displaying?
- Do your videos have sound? Do you want to hear your videos during playback?
- Is any of your content from YouTube or other websites?
- Do you want to display a live video feed in addition to digital files?
- Are you comfortable controlling the playback of your digital media yourself?
- Do you use PowerPoint and are you very familiar with all of its features?
- Do you create your own videos or have a content producer you work with? Ad agency?

When to bring in a specialist:

- When a client has multiple *types* of content or high *quantity* of content
- When a client wants to trigger videos within a live presentation
- When a client wants to integrate their product functions into PPP system control
Example: At a certain point in my video, I want my live demo printer to print a test page
- When a client has a unique set-up requiring motion sensors or custom triggering requests
- When a client would feel more comfortable having a technician there in person
