

Three Covid-19 Touchless Solutions for Interactive Displays using Pro-Player Plus

QR Codes:

PP+ can be triggered to display digital content by using a personal phone or tablet to read a QR Code. Most mobile phones cameras can read a QR Code and be directed to a related link. Your customers can feel safe interacting with a display using their personal cell phone. You can also choose to provide sanitized tablets that function the same way allowing for safe personal interactivity.

Proximity Sensors:

PP+ can be connected to multiple proximity sensors and used to trigger your digital content based on a preset distance for the sensors. Imagine walking up to a large SEG graphic wall, placing your hand 24" in front of a trigger point and a product overview video starts to deliver your message.

If a customer wants more detailed info (a deep dive), just place a hand 12" in front of that same trigger point and a more detailed video begins to play. This is a great way to turn large SEG printed graphics into digital interactive displays. PP+ can accomplish this without any development time or custom coding, just connect your sensors and use our simple dropdown menu to set the trigger distance and media file to play ... a simple yet powerful touchless solution available now.

Gesture Control:

PP+ can be triggered to display your digital content using simple hand gestures. No need to touch anything, just follow a simple set of hand icons and your customers can drive your content quickly and easily without touching anything.

Add additional excitement and engagement by connecting all your technologies together under one simple control system. PP+ has powerful builtin features to control lights, sound and even kinetic effects. All of these can be easily incorporated into any of the touchless systems presented above.

We have the touchless solutions you need to get thru this Covid-19 era without the extra costs associated with custom system builds and coding.
